

Java Inbuilt Functions: Strings and Arrays

Java String Inbuilt Functions

`length()`: Returns the length of the string

`charAt(int index)`: Returns character at specified index

`substring()`: Returns substring

`contains(CharSequence s)`: Checks if string contains a sequence

`equals(String another)`: Compares two strings (case-sensitive)

`equalsIgnoreCase(String another)`: Compares two strings (ignores case)

`compareTo(String another)`: Lexicographically compares two strings

`toLowerCase()` / `toUpperCase()`: Converts case

`trim()`: Removes leading/trailing whitespace

`replace()` / `replaceAll()`: Replaces characters or substrings

`indexOf()` / `lastIndexOf()`: Returns index of first/last occurrence

`startsWith()` / `endsWith()`: Checks prefix/suffix

`isEmpty()`: Checks if string is empty

`split(String regex)`: Splits string into array

`toCharArray()`: Converts string to char array

`format()`: Returns formatted string

Java Array Inbuilt Functions

`Arrays.toString(array)`: Returns string representation of array

`Arrays.sort(array)`: Sorts array in ascending order

`Arrays.copyOf(array, newLength)`: Copies array to new length

`Arrays.copyOfRange(array, start, end)`: Copies range of elements

`Arrays.equals(arr1, arr2)`: Compares arrays for equality

`Arrays.fill(array, value)`: Fills array with given value

`Arrays.binarySearch(array, key)`: Performs binary search (must be sorted)

`Arrays.asList(array)`: Converts array to List (for object arrays)

`Arrays.hashCode(array)`: Returns hash code of array

`Arrays.stream(array)`: Converts array to stream (for functional ops)

`Arrays.deepToString(array)`: String representation of 2D+ arrays

`Arrays.deepEquals(arr1, arr2)`: Deep equality check for 2D+ arrays
